

Meridian

Autonomous Prediction Markets for the Non-English World · Agora Agents Hackathon · Canteen x Circle · May 2026

The Problem

0:00 – 0:30

"Polymarket has \$1B in open interest — and almost every market is in English, about US events."

Prediction markets are the best forecasting tool ever built. But they only work where information meets liquidity. Today, **billions of economic decisions** made in Arabic, French, Portuguese, Korean, and Yoruba are completely invisible to markets.

What's broken	Why it matters
90% of market liquidity is English-only	Emerging-market events go unpriced
New markets die thin — no bootstrapping	No one trades a market with zero liquidity
Translation quality is unverifiable	Who grades the AI? The market should.
Idle AMM capital earns 0%	Capital efficiency is wasted

The Solution

0:30 – 1:15

Meridian is a self-sustaining prediction market factory. An AI agent monitors foreign-language news, structures markets, stakes its own USDC on its probability estimates, and earns a builder fee on every trade.

Skin-in-the-game translation: The agent doesn't just translate — it bets on its own answer. If its P(YES) is wrong, it loses money. The market becomes the quality oracle.

FOR TRADERS

Bet on events the English internet hasn't priced yet. Trade with real USDC against an honest AMM that has committed capital.

FOR THE AGENT

Each market it creates earns 0.5% on every buy. Idle capital parks in Circle USYC for yield between fills. P&L is fully on-chain.

Live Demo

1:15 – 2:00

WHAT YOU'RE ABOUT TO SEE — LIVE ON ARC TESTNET

- 1 **Agent loop fires** — Claude scans 40+ RSS feeds across 12 languages, picks a high-confidence event, generates a binary question + resolution criteria + P(YES)
- 2 **Market deploys on-chain** — `MeridianMarket.createMarket()` is called. The agent immediately stakes USDC into the new market via `AgentVault.deployCapital()`
- 3 **User connects & trades** — USDC approval + buy in one click. LMSR pricing shifts on every fill. Price impact shown live.
- 4 **Resolution** — After deadline, admin oracle resolves YES/NO on-chain. Winners claim pro-rata share of the full collateral pool.
- 5 **Portfolio** — Wallet-connected view of open positions and claimable winnings, all read from on-chain state.

Architecture

2:00 – 2:30

```
News (40+ RSS feeds, 12 languages)
  ↓ Claude AI – translate + structure + P(YES)
MeridianMarket.sol ↔ ResolutionOracle.sol
(LMSR AMM registry)   (Tier 1: price feed / Tier 2: admin)
  ↑
AgentVault.sol – deploys capital, claims winnings, parks idle in USYC
  ↑
Circle Programmable Wallet – agent's USDC reserve
```

Layer	Technology
Chain	Arc Testnet (Chain ID 5042002) — USDC native gas
AI	Claude Sonnet (Anthropic) — news parsing + structuring
Wallets	Circle Programmable Wallets (agent) + Privy Embedded (users)
Yield	Circle USYC via Teller bridge — idle capital earns
Identity	ERC-8004 on-chain agent identity + reputation registry

ARC TESTNET — TRADEABLE NOW

Why Now · Why This Stack

2:45 – 3:00

Arc's USDC-native chain eliminates the ETH/gas-token UX tax that kills prediction market adoption. Every fee, every stake, every payout is in the same token the user thinks in.

Circle Programmable Wallets

The agent has a real on-chain identity with a real balance. No multisig, no human signing ceremony — fully autonomous.

USYC Idle Yield

Reserves earn ~5% APY when not deployed. The agent's capital is always working — in a market or in a money-market fund.
